RESEARCH,NAGPUR**

An Autonomous Institute, Affiliated to RTMNU, Nagpur

Problem statement

Create Contact Book using Python :

Develop a Python-based Contact Book that enables users to efficiently store, organize, search, update, and manage personal or professional contact information. The application should allow users to add new contacts, edit existing contact details, search contacts by name or phone number, delete unwanted contacts, and display all saved contacts. The system should permanently store contact records using file handling or a database, ensuring that information is retained even after the application is closed. The application should provide a simple, menu-driven, and user-friendly interface while demonstrating fundamental Python programming concepts.

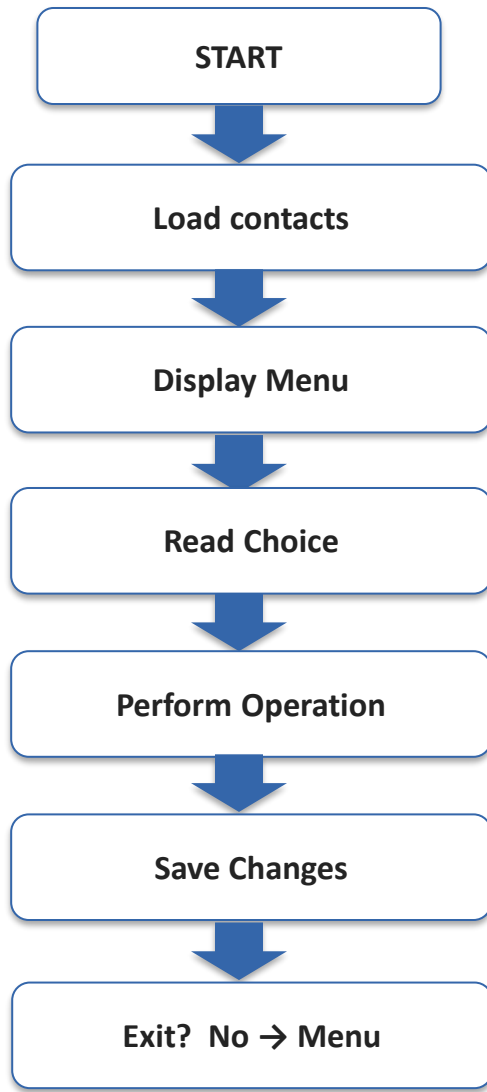

Objectives

- Develop a simple Python-based contact management system.
- Store contact details in an organized structure.
- Provide Add, View, Search, Edit and Delete operations.
- Use file handling for permanent storage of contact information.
- Apply Python concepts such as variables, dictionaries/lists, functions, conditions and loops.
- Track project development using GitHub.

Algorithm

1. Start the program.
2. Load previously saved contacts from the file.
3. Display the main menu.
4. Accept the user's choice.
5. Perform Add, View, Search, Edit or Delete operation.
6. Save the updated contact information.
7. Return to the main menu.
8. Repeat until the user selects Exit.
9. Stop the program.

Flowchart / Pseudocode

START
Load contacts

WHILE True:
 Display menu
 Read choice

 IF Add → add contact
 ELSE IF View → display contacts
 ELSE IF Search → find contact
 ELSE IF Edit → update contact
 ELSE IF Delete → remove contact
 ELSE IF Exit → STOP
 ELSE → show invalid choice

Save changes

Understanding of Python Logic

Variables

store name, phone number and email

Dictionary / List

organize individual and multiple contacts

Functions

separate Add, View, Search, Edit and Delete operations

if-elif-else

process the selected menu option

while loop

keep the menu running until Exit

File handling

save and load contacts permanently

Exception handling

manage invalid input and runtime errors

GitHub & Project Development

- Create a GitHub account and a repository named Python-Contact-Book.
- Upload the Python source code and project documentation.
- Use meaningful commits to show the development stages.
- Maintain the repository as the project is improved and tested.
- Example commits: Initial setup → Add Contact → Search → Edit/Delete → File Handling → README update.

Thank You
